HackCortona 2026

Guest registration automation and stay management

Local OCR / Browser automation / WebCheckIn / Web management system | October 2026

One of the HTT prototype interfaces developed by the team during HackCortona.

Winning team

three days of work, eight participants

OBJECTIVE

Reduce repetitive steps in guest management by connecting the guest journey, staff activities and preparation of registration requirements.

MY CONTRIBUTION

I developed the OCR and WebCheckIn automation script and the initial version of the management application. The application was subsequently modified during the project, so the final version also includes later team contributions.

ENGINEERING APPROACH

- Local document processing using OCR, data review and automated WebCheckIn form completion.
- Preparation of the Alloggiati Web file, with review and submission retained under operator control.
- Development of the initial management application, subsequently modified during the team project.

RESULTS

The team project integrates a guest portal, a management system and registration automation. The report documents the automation running on the actual portal. The team won the event.

SCOPE AND LIMITATIONS

Prototype developed during a hackathon. Pending integrations and the report's financial estimates are not presented as savings already achieved in operation.
